Subject: Programming With Python (01CT1309)	Aim: Practical based on Data Loading, Storage and File Formats	
Experiment No: 22	Date:	Enrollment No: 92510133028

Aim: Practical based on Data Loading, Storage and File Formats

IDE:

load, manipulate, and store data using Python (over reading and writing CSV, JSON, and Excel files)

Library Installation

pip install pandas openpyxl

Sample Data:

Create a folder for this experiment and add the following sample data files:

sample_data.csv (Name,Age,City)

Alice,30,New York

Bob,25,Los Angeles

Charlie,35,Chicago)

sample_data.json ([

{"Name": "David", "Age": 28, "City": "San Francisco"},

{"Name": "Eve", "Age": 22, "City": "Seattle"}

])

sample_data.xlsx (you can create this using Excel with similar data)\\

Loading Data from CSV

Read the CSV file and perform basic data manipulation.

import pandas as pd

Load data from CSV

 Marwadi University <small>Marwadi Chandarana Group</small>	 NAAC A+	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology
Subject: Programming With Python (01CT1309)	Aim: Practical based on Data Loading, Storage and File Formats	
Experiment No: 22	Date:	Enrollment No: 92510133028

```
csv_file_path = 'sample_data.csv'
```

```
df_csv = pd.read_csv(csv_file_path)
```

```
# Display the DataFrame
```

```
print("CSV Data:")
```

```
print(df_csv)
```

```
# Basic data manipulation: Filter by age
```

```
filtered_data = df_csv[df_csv['Age'] > 30]
```

```
print("\nFiltered Data (Age > 30):")
```

```
print(filtered_data)
```

Output:

CSV Data:

	Name	Age	City
0	Alice	30	New York
1	Bob	25	Los Angeles
2	Charlie	35	Chicago

Filtered Data (Age > 30):

	Name	Age	City
2	Charlie	35	Chicago

Loading Data from JSON

Read the JSON file and manipulate the data.

```
# Load data from JSON
```

 Marwadi University <small>Marwadi Chandarana Group</small>	 NAAC A+	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology
Subject: Programming With Python (01CT1309)	Aim: Practical based on Data Loading, Storage and File Formats	
Experiment No: 22	Date:	Enrollment No: 92510133028

```
json_file_path = 'sample_data.json'

df_json = pd.read_json(json_file_path)
```

```
# Display the DataFrame

print("\nJSON Data:")

print(df_json)
```

```
# Basic data manipulation: Find the average age

average_age = df_json['Age'].mean()

print("\nAverage Age:", average_age)
```

Output:

```
JSON Data:
      Name   Age          City
0    David    28  San Francisco
1     Eve    22         Seattle

Average Age: 25.0
```

Loading Data from Excel

Read the Excel file and display its contents.

```
# Load data from Excel

excel_file_path = 'sample_data.xlsx'

df_excel = pd.read_excel(excel_file_path)
```

 Marwadi University <small>Marwadi Chandarana Group</small>	 NAAC A+	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology
Subject: Programming With Python (01CT1309)	Aim: Practical based on Data Loading, Storage and File Formats	
Experiment No: 22	Date:	Enrollment No: 92510133028

```
# Display the DataFrame
```

```
print("\nExcel Data:")
print(df_excel)
```

```
# Basic data manipulation: Count the number of entries
```

```
entry_count = df_excel.shape[0]
print("\nNumber of entries in Excel file:", entry_count)
```

Output:

```
Excel Data:
      Name  Age          City
0    Alice   30      New York
1      Bob   25    Los Angeles
2  Charlie   35      Chicago
3   David   28  San Francisco
4     Eve   22      Seattle
```

Writing Data to Different Formats

Save manipulated DataFrames to new files in different formats.

```
# Save filtered CSV data to a new file
```

```
filtered_data.to_csv('filtered_data.csv', index=False)
print("\nFiltered data saved to 'filtered_data.csv'.")
```

Subject: Programming With Python (01CT1309)

Aim: Practical based on Data Loading, Storage and File Formats

Experiment No: 22

Date:

Enrollment No: 92510133028

```
# Save DataFrame to a new JSON file
```

```
df_json.to_json('new_data.json', orient='records', lines=True)
```

```
print("JSON data saved to 'new_data.json'.")
```

```
# Save DataFrame to a new Excel file
```

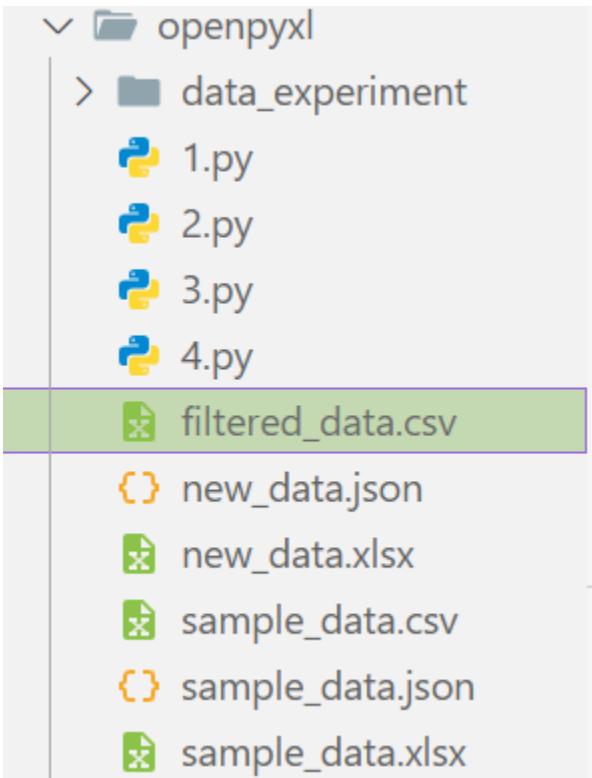

```
df_excel.to_excel('new_data.xlsx', index=False)
```

```
print("Excel data saved to 'new_data.xlsx'.")
```

Output:

	A1	v	🔍	fx	Name
1	Name	Age	City		
2	Alice	30	New York		
3	Bob	25	Los Angeles		
4					
5					
6

Post Lab:

https://github.com/keshvi1234/PWP_experiment

Write a code snippet to check the data types of each column in a DataFrame.

Code:

```

import pandas as pd

df_csv = pd.read_csv(r"D:\SEM 3 Subjects\Python\openpyxl\sample_data.csv")
df_json = pd.read_json(r"D:\SEM 3 Subjects\Python\openpyxl\sample_data.json")
df_excel = pd.read_excel(r"D:\SEM 3 Subjects\Python\openpyxl\sample_data.xlsx")
def check_data_types(df, name):
    print(f"\nData Types for {name}:")
    print(df.dtypes)

check_data_types(df_csv, "CSV DataFrame")
check_data_types(df_json, "JSON DataFrame")
check_data_types(df_excel, "Excel DataFrame")
  
```

 Marwadi University <small>Marwadi Chandarana Group</small>	NAAC  A+	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology
Subject: Programming With Python (01CT1309)	Aim: Practical based on Data Loading, Storage and File Formats	
Experiment No: 22	Date:	Enrollment No: 92510133028

Output:

```
Data Types for CSV DataFrame:
```

```
Name    object
Age     int64
City    object
dtype: object
```

```
Data Types for JSON DataFrame:
```

```
Name    object
Age     int64
City    object
dtype: object
```

```
Data Types for Excel DataFrame:
```

```
Name    object
Age     int64
City    object
dtype: object
```

```
PS D:\SEM 3 Subjects\Python>
```

Write a code snippet that demonstrates how to fill missing values with the mean of a column.

Code:

```
import pandas as pd
import numpy as np

df_csv = pd.read_csv(r"D:\SEM 3 Subjects\Python\openpyxl\sample_data.csv")
df_json = pd.read_json(r"D:\SEM 3 Subjects\Python\openpyxl\sample_data.json")
df_excel = pd.read_excel(r"D:\SEM 3 Subjects\Python\openpyxl\sample_data.xlsx")

df_csv.loc[1, 'Age'] = np.nan # CSV DataFrame
df_json.loc[1, 'Age'] = np.nan
df_excel.loc[1, 'Age'] = np.nan
```

Subject: Programming With Python (01CT1309)

Aim: Practical based on Data Loading, Storage and File Formats

Experiment No: 22

Date:

Enrollment No: 92510133028

```
def fill_missing_with_mean(df, name):
    df['Age'] = df['Age'].fillna(df['Age'].mean())
    print(f"\n{name} after filling missing 'Age' values with mean:")
    print(df)

fill_missing_with_mean(df_csv, "CSV DataFrame")
fill_missing_with_mean(df_json, "JSON DataFrame")
fill_missing_with_mean(df_excel, "Excel DataFrame")
```

Output:

CSV DataFrame after filling missing 'Age' values with mean:

	Name	Age	City
0	Alice	30.0	New York
1	Bob	32.5	Los Angeles
2	Charlie	35.0	Chicago

JSON DataFrame after filling missing 'Age' values with mean:

	Name	Age	City
0	David	28.0	San Francisco
1	Eve	28.0	Seattle

Excel DataFrame after filling missing 'Age' values with mean:

	Name	Age	City
0	Alice	30.00	New York
1	Bob	28.75	Los Angeles
2	Charlie	35.00	Chicago
3	David	28.00	San Francisco
4	Eve	22.00	Seattle
